1. Introduction

1.1. Purpose

This Software Requirements Specification (SRS) document defines the functional and non-functional requirements for Clinexa, a smart healthcare platform that facilitates communication and management between doctors and patients. This document provides a detailed description of the system's features, user interactions, and operational constraints. It serves as a reference for the development team, stakeholders, and testers throughout the software development life cycle.

1.2. Scope

Clinexa is a web-based healthcare management system designed to improve the efficiency and accessibility of medical services. The platform allows patients to book appointments, communicate with doctors, and access their medical records. Doctors can also manage patient data and schedule consultations.

The system aims to:

- Enhance communication between doctors and patients.
- Simplify appointment scheduling and medical record management.
- Reduce administrative overhead in healthcare services.

1.3. Definitions

- SRS: Software Requirements Specification.
- UI: User Interface.
- UX: User Experience.
- CMS: Clinexa Management System.
- Clinexa: The proposed smart healthcare management system.
- Patient: The end user who uses the system to book appointments and access healthcare services.
- Doctor: The medical professional who provides consultations and manages patient records within the system.

1.4. References

1. Course Project Guidelines – CSAI 203 Introduction to Software Engineering, Fall 2025.

2. Project Repository Documentation (GitHub).

1.5. Overview

This document outlines the purpose, scope, and functionality of the Clinexa system. Subsequent sections will describe:

- System features and user requirements.
- Functional and non-functional requirements.

The goal is to ensure that all stakeholders have a clear, shared understanding of what the system will deliver.

2. System Overview

2.1. Platform Perspective

The CMS replaces manual paper-based systems with a digital solution (web application) to reduce errors, save time, and improve coordination between doctors and patients.

2.2. Application Functions

1. User login and role-based access
2. Manage doctor and patient profiles
3. Schedule, reschedule, cancel appointments
4. Search patients and appointments
5. Generate operational reports
6. Send automated notifications
7. Link patients to their doctors

2.3. User Classes

- Registered Users: Can browse time slots, book anyone.
- Doctors: Can specify time slots, cancel appointments, and show patient medical history.

2.4. Operating Environment

- Client-side: Runs in web browsers such as Chrome and Firefox.
- Server Side: Hosted on a cloud server running Flask.
- File system: Storing and reading data from the file.

2.5. Constraints

- Must use UML 2.5 for diagrams.
- Backend: Flask.
- Frontend: HTML and CSS.
- Diagrams: draw.io or Lucidchart.

2.6. User Documentation

- User Manual (PDF)
- Online Help within the system

2.7. Assumptions and Dependencies

- Internet connection available
- Users have basic computer skills
- Email/SMS gateway API available

3. Specific Requirements

3.1. Functional Requirements

FR1: User Login

Scenarios:

- Valid credentials → access dashboard (all features)
- Invalid → show error (3 attempts → lock 5 mins)
- Forgotten password → reset via email/receptionist

FR2: Edit Profile

Scenarios:

- Doctor updates availability hours
- Receptionist updates contact info

FR3: Add / Remove Patient

Scenarios:

- Add a patient with a medical history
- Remove patient (archive, not delete from DB)

FR4: Schedule Appointment

Scenarios:

- Check doctor availability
- Prevent double-booking
- Cancel the booked appointment if the patient wants

FR5: Manage Appointments

Scenarios:

- The doctor views today's list
- Patient cancels 24h before

FR6: Search

Scenarios:

- Partial name match
- Search appointments by date/doctor

FR7: Generate Reports

Scenarios:

- Daily appointments
- Patient visit history
- Doctor workload

FR8: Send Notifications

Scenarios:

- 24h before appointment → SMS/Email
- Appointment confirmed → both parties

FR9: Manage Medical Records

Scenarios:

- Add a new prescription after consultation.
- View patient history before the new appointment.
- Update diagnosis or notes.

FR10: Feedback and Rating System

Scenarios:

- The patient submits feedback after the completed session.
- Admin reviews ratings for performance analysis.

3.2. Use Case Model

Use Case Descriptions

3.3. Domain Model

Conceptual Class Diagram

(Add diagram image if available)

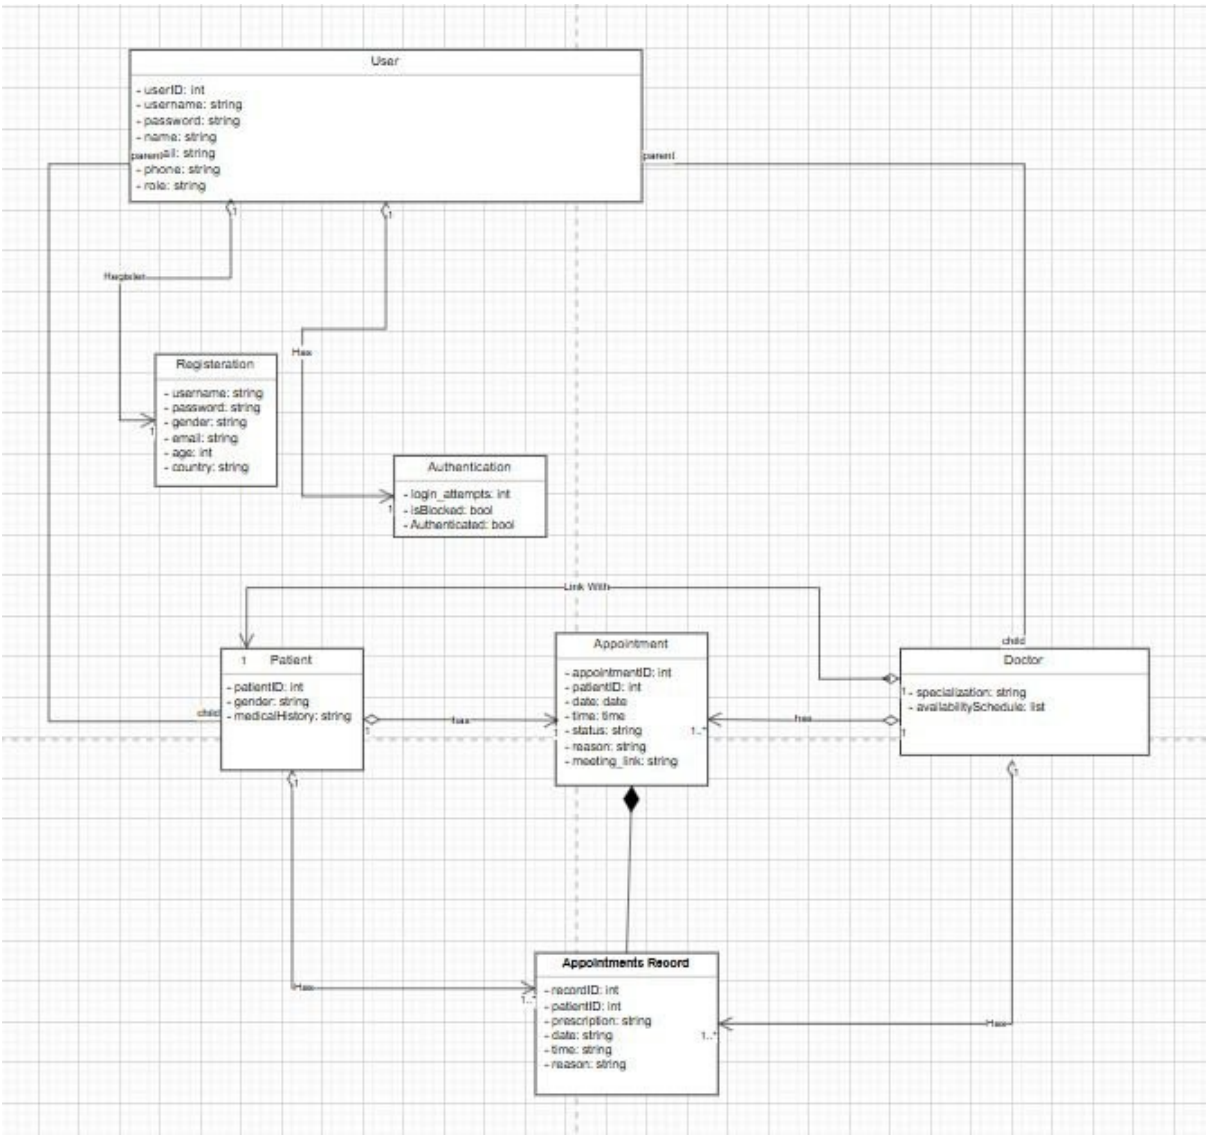

Figure 3.1: class diagram

Use Case	Actors	Description	Relationships
Login	Patient, Doctor	Allows users to access the system securely.	extend Security
Edit_Profile	Patient	Enables users to update their personal information.	extend Profile_Information
Profile_Information	Patient	Displays user profile details.	
Notification	Patient	Sends alerts or updates to users.	extend Usability
System_Scheduling	Doctor	Manages scheduling of appointments and availability.	include Notification
Appointment Management	Patient	Handles booking, rescheduling, and cancellation of appointments.	extend Reports, include Login
Reports	Doctor	Generates and views patient reports.	
Search	Patient, Doctor	Allows users to search for information or profiles.	include Reports
Add/Remove_Patient	Doctor	Enables doctors to manage patient records.	include Profile_Linking
Profile_Linking	Doctor	Links patient profiles for shared access or referrals.	
Usability	Patient, Doctor	Enhances user experience and accessibility.	
Security	Patient, Doctor	Ensures data protection and secure access.	

Table 3.1: Use Case Descriptions

Class Descriptions

(Keep all class table content unchanged.)

3.4. Non-Functional Requirements

3.4.1. Reliability and Availability

- The platform should maintain 99.9% uptime.
- Recovery time after a system failure should be within 5 minutes.

3.4.2. Maintainability

- The success rate of the maintenance will be 90%.
- The maintenance speed will be 95%.

3.5. External Interface Requirements

3.5.1. User Interface

Clinexa will provide a responsive web-based interface accessible from any browser (Google Chrome, Firefox). The interface will include login pages, dashboards for doctors and patients, appointment scheduling screens, and show reports.

3.5.2. Hardware Interface

The system will run on standard computing devices, such as desktops, laptops, and tablets. No special hardware is required, except a device with a stable internet connection and web browser.

3.5.3. Software Interface

The system will run on standard computing devices, such as desktops, laptops, and tablets. No special hardware is required, except a device with a stable internet connection and web browser.

3.5.4. Communication Interface

Clinexa will use HTTP/HTTPS protocols for client–server communication to ensure security and reliability. SMTP protocol will be used for email notifications.

4. Appendices

4.1. Appendix A: Data Dictionary

SRS: Software Requirements Specification.
UI: User Interface.
UX: User Experience.
CMS: Clinexa Management System.
Clinexa: The proposed smart healthcare management system.
Patient: The end user who uses the system to book appointments and access healthcare services.
Doctor: The medical professional who provides consultations and manages patient records within the system.

4.2. Appendix B: Glossary

Clinexa: The smart healthcare management system developed in this project.
User: Any individual interacting with the system (Doctor, Patient, or Admin).
Doctor: A medical professional responsible for consultations and managing patients.
Patient: A registered user who books appointments and receives medical care.
Appointment: A scheduled meeting between a doctor and a patient.
Appointment Record: The record created after an appointment, containing diagnosis and prescription details.
Authentication: The process of verifying user credentials (login validation).
Registration: The process of creating a new user account in the system.
Notification: Automated messages (email or SMS) for reminders or confirmations.
